Criterion	What was evaluated
Technical detection	Whether the platform natively monitors signals and detects anomalies or outages.
Incident list	Availability of a centralized, searchable and filterable incident view.
Technical detail	Depth of metrics, logs, charts, network evidence and diagnostic information.
Geographic context	Ability to identify affected countries, locations, networks or providers.
Severity and prioritization	Native priorities, severity levels, statuses, sorting and filtering.
Slack integration	Whether users can receive, update or manage incidents from Slack.
Timeline and history	Automatic recording of status changes, actions, notifications and recovery.
Operational actions	Ability to acknowledge, assign, escalate, automate or resolve incidents.
Customer impact	Ability to quantify affected users, devices, tests or services without additional data sources.

Rating	Meaning
Very high	A core product capability with extensive native functionality.
High	Strong native support, although it is not the product’s primary focus.
Medium	Partially supported or requires configuration and integrations.
Low	Limited support or not a central product capability.
Requires integration	The platform depends on external business or customer data.
